

CHERRY CREEK BASIN WATER QUALITY
AUTHORITY

***2021 CAPITAL IMPROVEMENT PROGRAM
SUPPORTING DATA***

TAC Draft – October 1, 2020
TAC Recommendation – November 5, 2020
Board Review Version – October 15, 2020
Board Adopted Version – **November 19, 2020**

2021 CAPITAL IMPROVEMENT PROGRAM

This document presents the details of the 2021 Capital Improvement Program as adopted by the Authority Board and includes the following information:

Table 1 – Summary of Potential Pollutant Reduction Facilities, Revision for 2021 CIP.

This table lists all the PRF projects that have been considered for implementation by the Authority since 2000 and shows their current status. The “green” font represents projects in progress and the “blue” font represents completed projects. The orange highlighted projects have been added or revised based on partner or staff requests received in 2020.

Prior to 2010, Cherry Creek Reservoir was under a total maximum annual load (TMAL) limitation for phosphorus. Since PRFs originally focused on reduction of phosphorus loads discharged into the reservoir, the table was developed to provide a brief summary of the design basis, projected loads and treatment, and estimated PRF costs and costs per pound of phosphorus immobilized. Currently there is no TMAL; instead the control strategy identified in Control Regulation No. 72 is to minimize nutrient (phosphorus and nitrogen) concentrations. Therefore, PRFs are still evaluated, in part, on their costs per pound for consistency between all potential PRFs (see also Stream Reclamation Unit Costs below). Additional information on how PRFs are evaluated, particularly stream reclamation type projects, is presented in the Authority’s report dated June 17, 2011 titled *Stream Reclamation Water Quality Benefit Evaluation Interim Status Report*.

The Cattail Harvesting Pilot Project included phosphorus reduction/removed from the system based on 2020 Cattail Harvesting Pilot Project Memo.

The Water Quality Pond update projects don’t include an estimate of Phosphorus, and are expected to optimize performance and facilitate maintenance which will likely have a water quality benefit and ensure performance. The cost share for these projects has been simplified to (25% CCBWQA, and 75% partner). The on-going maintenance of these PRFs outside of Cherry Creek State Park (CCSP) are still 100% partner funded.

Table 2 – Summary of Recommended Pollutant Reduction Facilities 2021 – 2030 Budget Projections

This table lists the PRFs that are in the current, 10-year CIP projection with more detail provided for the projects in the current budget year. Since the Authority partners with other governmental agencies to design and construct some of the PRFs, the Authority’s portion of total project costs is also shown. The column labeled “obligated funds” represents the total amount approved by the Authority for the project prior to the budget year, since most projects take several years from concept through construction. Funds are considered “obligated” once the Board approves funding at a regular Board meeting.

2021 Operations and Maintenance Budget Detail

These tables provide further 2021 budget detail for operations and maintenance activities proposed for the constructed PRF's including the Reservoir Mixing System (i.e.: compressor and aeration system maintenance).

2021 Stream Reclamation Unit Costs

These figures show the stream reclamation unit costs. Figure 1 is for PRFs within CCSP that are fully CCBWQA funded and Figure 2 for projects outside of CCSP that are shared funding.

CCBWQA's funding was adjusted on CCB13.5.1 to 16% and CCB13.5.2 to 20% to have the unit cost of Phosphorus to get under the \$750/pound of similar projects.
